Health concerns across the LGBTQIA+ spectrum

Dar-Nimrod I et al

Scientific Reports 16 (1) 1-3

Editorial: Pride in Frontiers in Human Neuroscience

Pride is a multifaceted emotion grounded in honor, dignity, and self-respect, arising not only from personal accomplishments but also from the achievements of those with whom we share identity and community. This emotion is often amplified when success follows adversity, a dynamic that resonates deeply with the histories of many minority groups, particularly lesbian, gay, bisexual, transgender, queer, intersex, asexual, and people with other sexual orientations and forms of gender expression (LGBTQIA+). Research in the broad field of neuroscience has contributed to highlight issues central to LGBTQIA+ experiences, including those faced by LGBTQIA+ scientists (Freeman, 2021), and has begun to outline evidence-based strategies to address them. The Pride in Frontiers in Human Neuroscience Research Topic brings together a historical overview of neuroscience research involving LGBTQIA+ populations and highlights recent scientific advances with clinical relevance for the mental, cognitive, and neurological health of this community, with particular attention to transgender and gender diverse individuals.
